# Equivalent States

- To minimize a DFA, we must identify states that are “equivalent.”
- When two states are equivalent, one of them may be eliminated.

## Definition (Equivalent states)

Two states in a DFA are **equivalent** if, for any input, the decision of whether to accept or reject it will be the same regardless of which of the two states we are currently in.

# Example

## Example (Equivalent states)

Clearly, states 2 and 3 are equivalent and states 4 and 5 are equivalent.

# Example

## Example (Equivalent states)

Clearly, states 2 and 3 are equivalent and states 4 and 5 are equivalent.

# Example

## Example (Equivalent states)

Clearly, states 2 and 3 are equivalent and states 4 and 5 are equivalent.

# Outline

- 1 Equivalent States

- 3 Minimization Examples
- 4 Assignment

# Equivalence of States

## Definition (0-equivalence of states)

Two states  $q$  and  $q'$  are **0-equivalent** if

- Both are accepting states, or
- Both are rejecting states.

## Definition ( $n$ -equivalence of states)

Let  $n$  be a positive integer. Two states  $q$  and  $q'$  are  **$n$ -equivalent** if the states  $\delta(q, a)$  and  $\delta(q', a)$  are  $(n - 1)$ -equivalent for all  $a \in \Sigma$ .

## Definition (Equivalence of states)

Two states are **equivalent** if they are  $n$ -equivalent for all  $n \geq 0$ .

# Determining Equivalent States

- To determine which states are equivalent,
  - Add a “dead” state, if necessary, to make the DFA fully defined.
  - Determine the 0-equivalence classes:  $F, Q - F$ .
  - From the 0-equivalence classes, determine the 1-equivalence classes.
  - From the 1-equivalence classes, determine the 2-equivalence classes.
  - And so on, until, for some  $n$ , the  $n$ -equivalence classes and the  $(n - 1)$ -equivalence classes are the same.

# Determining Equivalent States

- At that point, the equivalence classes are the  $n$ -equivalence classes.
- Redraw the DFA, lumping all states of an equivalence class together as a single state.

# Outline

- 1 Equivalent States
- 2  $n$ -Equivalence
- 3 Minimization Examples**
- 4 Assignment

# Example

## Example (Minimizing a DFA)

Minimize the following DFA:

# Example

## Example (Minimizing a DFA)

- The 0-equivalence classes are

$$F = \{10\}$$

and

$$Q - F = \{1, 2, 3, 4, 5, 6, 7, 8, 9\}.$$

# Example

## Example (Minimizing a DFA)

- Summarize the transitions in the following tables.

	1	2	3	4	5	6	7	8	9		10
<b>a</b>	2	6	8	5	10	10	2	5	4	<b>a</b>	10
<b>b</b>	7	3	9	3	7	3	9	7	10	<b>b</b>	10

- Identify each entry with one of the 0-equivalence classes

	1	2	3	4	5	6	7	8	9		10
<b>a</b>	A	A	A	A	B	B	A	A	A	<b>a</b>	B
<b>b</b>	A	A	A	A	A	A	A	A	B	<b>b</b>	B

# Example

## Example (Minimizing a DFA)

- There are three patterns within  $\{1, 2, 3, 4, 5, 6, 7, 8, 9\}$ :  $AA$ ,  $BA$ , and  $AB$ .
- These patterns subdivide the 0-equivalence classes into the 1-equivalence classes:

$$\{1, 2, 3, 4, 7, 8\}, \{5, 6\}, \{9\}, \{10\}.$$

# Example

## Example (Minimizing a DFA)

- Show the transitions for the 1-equivalence classes.

	1	2	3	4	7	8
<b>a</b>	2	6	8	5	2	5
<b>b</b>	7	3	9	3	9	7

	5	6
<b>a</b>	10	10
<b>b</b>	7	3

	9
<b>a</b>	4
<b>b</b>	10

	10
<b>a</b>	10
<b>b</b>	10

- Identify each entry with a 1-equivalence class.

	1	2	3	4	7	8
<b>a</b>	A	B	A	B	A	B
<b>b</b>	A	A	C	A	C	A

	5	6
<b>a</b>	D	D
<b>b</b>	A	A

	9
<b>a</b>	A
<b>b</b>	D

	10
<b>a</b>	D
<b>b</b>	D

# Example

## Example (Minimizing a DFA)

- There are 3 different patterns within  $\{1, 2, 3, 4, 7, 8\}$ :  $AA$ ,  $BA$ , and  $AC$ .
- These patterns subdivide the 1-equivalence classes into the 2-equivalence classes:

$\{1\}, \{2, 4, 8\}, \{3, 7\}, \{5, 6\}, \{9\}, \{10\}.$

# Example

## Example (Minimizing a DFA)

- Show the transitions for the 2-equivalence classes.

	1		2	4	8		3	7		5	6		9		10
<b>a</b>	2	<b>a</b>	6	5	5	<b>a</b>	8	2	<b>a</b>	10	10	<b>a</b>	4	<b>a</b>	10
<b>b</b>	7	<b>b</b>	3	3	7	<b>b</b>	9	9	<b>b</b>	7	3	<b>b</b>	10	<b>b</b>	10

	1		2	4	8		3	7		5	6		9		10
<b>a</b>	<i>B</i>	<b>a</b>	<i>D</i>	<i>D</i>	<i>D</i>	<b>a</b>	<i>B</i>	<i>B</i>	<b>a</b>	<i>F</i>	<i>F</i>	<b>a</b>	<i>B</i>	<b>a</b>	<i>F</i>
<b>b</b>	<i>C</i>	<b>b</b>	<i>C</i>	<i>C</i>	<i>C</i>	<b>b</b>	<i>E</i>	<i>E</i>	<b>b</b>	<i>C</i>	<i>C</i>	<b>b</b>	<i>F</i>	<b>b</b>	<i>F</i>

# Example

## Example (Minimizing a DFA)

- Identify each entry with a 2-equivalence classes.
- The patterns are the same within each class.
- There is no further subdividing.
- Therefore, these are the final equivalence classes:

$\{1\}, \{2, 4, 8\}, \{3, 7\}, \{5, 6\}, \{9\}, \{10\}.$

# Example

- The final diagram:

# Example

## Example (Minimizing a DFA)

- Minimize the following NFA.

# Outline

- 1 Equivalent States
- 2  $n$ -Equivalence
- 3 Minimization Examples
- 4 Assignment**

# Assignment

## Assignment

- Read the algorithm described in Exercise 7.40, page 299. Study it until you understand how it is equivalent to the algorithm presented in class.
- Construct an NFA for the concatenation  $L_1 L_2$  of the following languages over the alphabet  $\{\mathbf{a}, \mathbf{b}\}$  and then minimize it.

$$L_1 = \{w \mid \text{the length of } w \text{ is at most } 1\}$$

$$L_2 = \{w \mid \text{every odd position of } w \text{ is } \mathbf{b}\}.$$

- Construct a minimal DFA for  $(L_1 \cup L_2)^*$  where

$$L_1 = \{w \mid w \text{ starts with } \mathbf{a} \text{ and has an even number of symbols}\}$$

$$L_2 = \{w \mid w \text{ starts with } \mathbf{b} \text{ and has an odd number of symbols}\}.$$
